

WATER TREATMENT FLOW DIAGRAM (Natural Spring Water)

Chlorine Injection
Sand Filter

- chlorine is injected simultaneously when the water is pumped into the overhead tank.
- first stage of water filtering system wherein water passes through sand and all impurities and hardness are filtered.

Carbon Filter
20 & 10 Micron Filters

- removes odor and color of water.
- removes further particles and other sediments not trapped in initial stage.

5 Micron Filter
Ozonator

- removes particles larger than 5 micron.
- acts as a strong oxidizing agent to purify the water.

Ultraviolet Sterlight Q 12 - removes pathogens and other bacteria present in the water.
